No class next Wednesday (12/4)

HW5 is posted on E3 (Due: 12/11 in class)

Erdős Number

- Six degree of separation?
- In math, Erdős Number embodies a similar principle

(the most prolific mathematician: 1500+ papers)

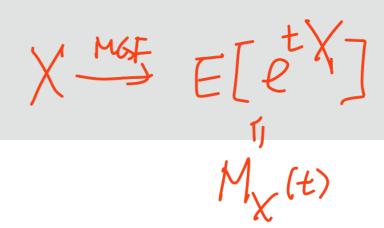

This Lecture

1. Moment Generating Functions (MGF)

2. Concentration Inequalities

Reading material: Chapter 11.1-11.3

Nice Properties of MGF?

Let X_1, X_2 be two random variables:

Suppose $M_{X_1}(t)=M_{X_2}(t)$, for all $t\in\mathbb{R}$. Do X_1 and X_2 always have the same distribution (i.e. the same CDF)?

2. ____ Could we find moments $E[X_1^n]$ by using $M_{X_1}(t)$?

Suppose X_1, X_2 are independent. Could we express $M_{X_1+X_2}(t)$ in terms of $M_{X_1}(t), M_{X_2}(t)$?

Nice Property (III): Why Is $M_X(t)$ Called the Moment Generating Function?

Recall: What is the "n-th moment" of X?

▶ Use MGF to Find Moments: Let X be a random variable with MGF $M_X(t)$. Then, for every $n \in \mathbb{N}$, we have

$$E[X^n] = \left(\frac{d^n}{dt^n} M_X(t)|_{t=0}\right)$$

Proof:
$$M_{\chi}(t) = E[e^{t\chi}] = \sum_{\text{all } \chi} e^{t\chi} P_{\chi}(\chi)$$

$$\frac{1}{dt} M_{\chi}(t) = \sum_{\text{all } \chi} \left(\frac{1}{dt} e^{t\chi} \right) P_{\chi}(\chi) \xrightarrow{t=0} \sum_{\text{all } \chi} \chi \cdot |P_{\chi}(\chi) = E[\chi]$$

$$\frac{1}{dt} M_{\chi}(t) = \sum_{\text{all } \chi} \left(\chi \cdot e^{t\chi} \right) P_{\chi}(\chi) \xrightarrow{t=0} \sum_{\text{all } \chi} \chi^{n} |P_{\chi}(\chi) = E[\chi]$$

$$\frac{1}{dt} M_{\chi}(t) = \sum_{\text{all } \chi} \left(\chi \cdot e^{t\chi} \right) P_{\chi}(\chi) \xrightarrow{t=0} \sum_{\text{all } \chi} \chi^{n} |P_{\chi}(\chi) = E[\chi]$$

Recap: Moment Generating Function (Formally)

Moment Generating Function (MGF): For a random variable X, define $M_X(t) = E[e^{tX}], \ t \in \mathbb{R}$

If there exists $\delta > 0$ such that $M_X(t) < \infty$ for all $t \in (-\delta, \delta)$, then $M_X(t)$ is called the moment generating function of X

• Question: Why do we emphasize $\underline{t \in (-\delta, \delta)}$?

For generating moments

(plugging in t=0)

Example: Moments of $Exp(\lambda)$

 $V_{av}[x] = E[x^2] - (E[x])$ $= \frac{2}{2^2} - \frac{1}{2^2} = \frac{1}{2^2}$

- Example: Suppose $X \sim \text{Exp}(\lambda)$
 - ▶ What is the MGF of *X*?
 - Use MGF to verify that $E[X] = \frac{1}{\lambda}$ and $Var[X] = \frac{1}{\lambda^2}$?

$$M_{X}(t) = E[e^{tX}]$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{0}^{\infty} \lambda \cdot e^{-\lambda X} dx$$

$$= \int_{0}^{\infty} (e^{tX}) / \lambda e^{-\lambda X} \int_{$$

2. Concentration Inequalities

Example: Tossing Moon Blocks

- 3 possible outcomes: Yes / No / Laughing
- p = P(outcome is "Yes")
 - Each toss is independent from other tosses
- Question: Suppose p is unknown
 - How to learn p?
 - Could we learn anything useful after n experiments?

Concentration Inequalities

Markov's Inequality

► Markov's Inequality: Let *X* be a <u>nonnegative</u> random

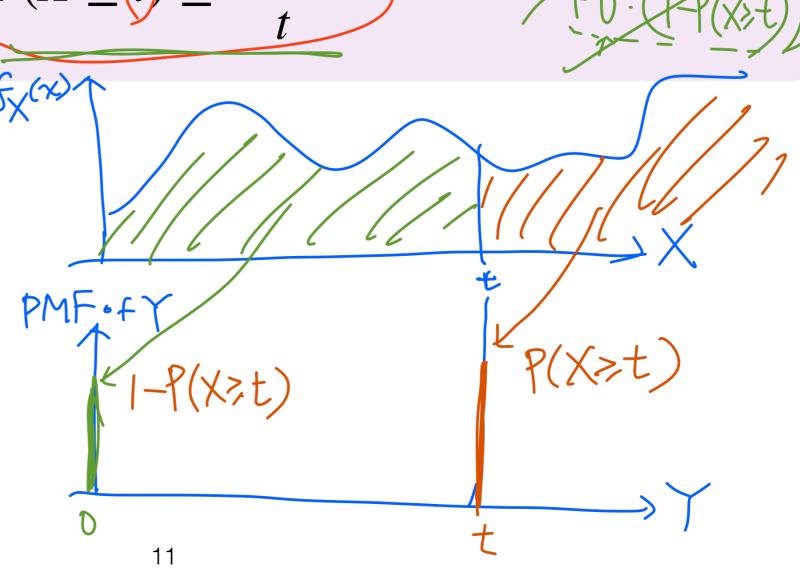

variable. Then, for any t > 0,

$$P(X \ge t) \le \frac{E[X]}{t}$$

Visualization:

$$Y = \begin{cases} t \\ 0 \end{cases} \times \ge t$$

$$(Y : \le Jiscretz)$$

Proof of Markov's Inequality

• Markov's Inequality: Let X be a nonnegative random variable. Then, for any t>0,

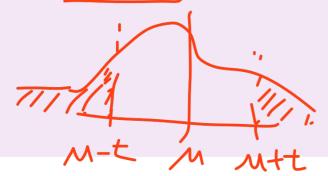

$$P(X \ge t) \le \frac{E[X]}{t}$$

Proof:

Please See the Prievrous Page

Chebyshev's Inequality

• Chebyshev's Inequality: Let X be a random variable with mean μ and variance σ^2 . Then, for any t > 0,

$$P(|X - \mu| \ge t) \le \frac{\sigma^2}{t^2}$$

Proof:

Define
$$Y = (X - M) \ge D$$

By Markon's inequality:

$$P(Y \ge t^2) \le \frac{E[X]}{t^2} = \frac{E[(X - M)^2]}{t^2} = \frac{T^2}{t^2}$$

$$P(|X - M| \ge t)^{\sigma} = \frac{T^2}{t^2}$$

Quick Review: Mean and Variance of Sum of Independent Random Variables

- ullet Example: Each X_i has mean μ_i and variance σ_i^2
 - X_1, X_2, \dots, X_n are assumed to be independent
 - Question 1: $E[X_1 + X_2 + \dots + X_n] = \mathcal{U}_{(+)}\mathcal{U}_{(2+)} \dots + \mathcal{U}_{(n)}$
 - Question 2: $E\left[\frac{1}{n}(X_1 + X_2 + \dots + X_n)\right] = \frac{1}{n}(\mathcal{M}_1 + \mathcal{M}_2 + \dots + \mathcal{M}_n)$

Quick Review: Mean and Variance of Sum of Independent Random Variables (Cont.)

- **Example:** Each X_i has mean μ_i and variance σ_i^2
 - $lacksquare{1}{1} X_1, X_2, \cdots, X_n$ are assumed to be independent

Question 3:
$$Var[X_1 + X_2 + \cdots + X_n] = \sigma_1 + \sigma_2 + \cdots + \sigma_n$$

Question 4: $Var[\frac{1}{n}(X_1 + X_2 + \cdots + X_n)] = h^2(\sigma_1 + \sigma_2 + \cdots + \sigma_n^2)$

$$= E[(X_1 + X_2 + \cdots + X_n - E[X_1 + \cdots + X_n])]$$

$$= E[(X_1 + X_2 + \cdots + X_n) + (X_2 - E[X_n]) + \cdots + (X_n - E[X_n])]$$

$$= Var(X_1) + Var(X_1) + Var(X_1) + \cdots + Var(X_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_2(X_1 + \cdots + X_n)]$$

$$= Var(X_1) + Var(X_1) + Cor(X_1 + X_2) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n) + \cdots + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n)$$

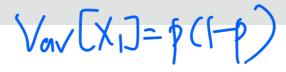

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n) + \sigma_n(x_n)$$

$$+ 2 \cdot (\sigma_1(X_1 + X_2 + \cdots + X_n)$$

Chebyshev's Inequality and Sample Mean

Example: Tossing moon blocks

- $\hbox{-} \ {\rm Each \ toss} \ X_i \ {\rm is} \ {\rm Bernoulli} \ {\rm with} \ P({\rm outcome \ is} \ "{\rm Yes}") = p$
- Each toss is independent from other tosses
- Question: Can we say anything about the sample mean

of
$$n$$
 tosses $\frac{1}{n}(X_1 + \dots + X_n)$?

$$P\left(\frac{1}{n}(X_1 + \dots + X_n)\right) > t$$

$$= \sum_{n=1}^{\infty} \frac{1}{n}(X_1 + \dots + X_n)$$

Chebyshev's Inequality and Sample Mean (Formally)

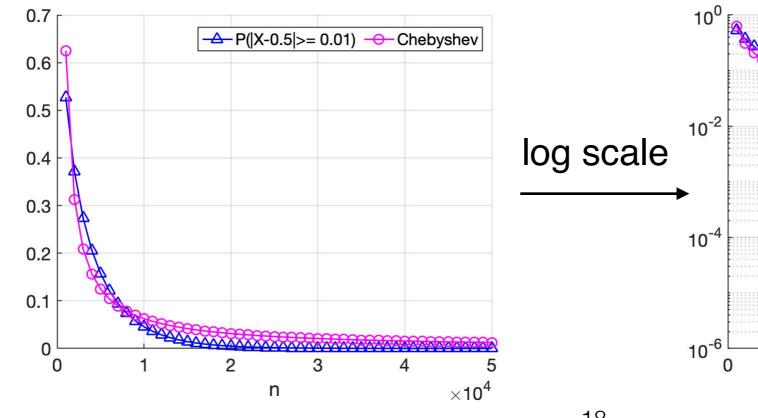

• Chebyshev's and Sample Mean: Let X_1, \dots, X_n be a sequence of independent and identically distributed (i.i.d.) random variables with mean μ and variance σ^2 . Define $\bar{X} = \frac{1}{n}(X_1 + \dots + X_n)$. Then, for any $\varepsilon > 0$, we have

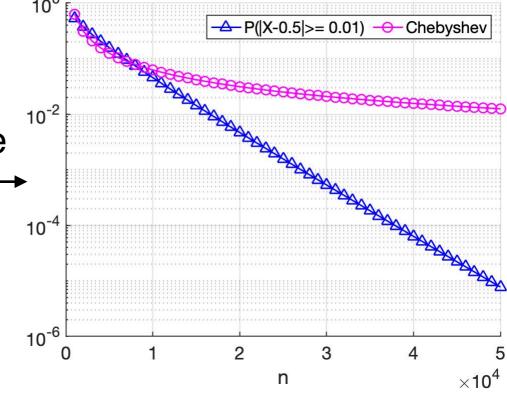

$$P(|\bar{X} - \mu| \ge \varepsilon) \le \frac{\sigma^2}{\varepsilon^2 n}$$

Any Issue With Chebyshev's Inequality?

- Example: X_1, \dots, X_n are i.i.d. Bernoulli with parameter 0.5
 - $E[X_i] =$ _____ and $Var[X_i] =$ _____
 - Chebyshev's: $P(|\bar{X} \mu| \ge \varepsilon) \le \frac{\sigma^2}{\varepsilon^2 n}$
 - Let's plot $P(|\bar{X} \mu| \ge \varepsilon)$ for small ε

$$\varepsilon = 0.01$$

Chernoff Bound

• Chernoff Bound: Let X be a random variable with MGF $M_X(t)$ Suppose $M_X(t)$ exists for all t in some set S. Then, for any t>0 and $t\in S$, for any $a\in \mathbb{R}$, we have

$$P(X \ge a) \le e^{-ta} \cdot M_X(t)$$

Proof:

Optimizing the Chernoff Bound

• Chernoff Bound: Let X be a random variable with MGF $M_X(t)$ Suppose $M_X(t)$ exists for all t in some set S. Then, for any t>0 and $t\in S$, for any $a\in \mathbb{R}$, we have

$$P(X \ge a) \le e^{-\phi(a)},$$

where
$$\phi(a) = \max_{t>0, t \in S} (ta - \ln M_X(t))$$

Proof:

Example: Chernoff Bound for Bernoulli R.V.s

- Example: Suppose $X \sim \text{Bernoulli}(p)$
 - What is $M_X(t)$?
 - ▶ What is the Chernoff bound for *X*? ($P(X \ge a) \le e^{-ta} \cdot M_X(t)$)

Example: Optimizing Chernoff Bound for Bernoulli R.V.s

- Example: Suppose $X \sim \text{Bernoulli}(p)$
 - How to optimize the Chernoff bound for X? $(P(X \ge a) \le e^{-\phi(a)}, \phi(a) = \max_{t>0, t \in S} (ta \ln M_X(t)))$

How about applying Chernoff bound to sum of independent random variables?

Hoeffding's Inequality (Formally)

► Hoeffding's Inequality (For Bernoulli): Let X_1, \dots, X_n be a sequence of i.i.d. Bernoulli random variables with parameter p. Define $\bar{X} = \frac{1}{n}(X_1 + \dots + X_n)$. Then, for any $\varepsilon > 0$, we have $P(|\bar{X} - p| \ge \varepsilon) \le 2 \exp(-2n\varepsilon^2)$

Proof of Hoeffding's Inequality (Positive Part)

$$P(\bar{X} - p \ge \varepsilon) \le \exp(-2n\varepsilon^2)$$

• [Hint] Chernoff bound: $P(X \ge a) \le e^{-ta} \cdot M_X(t)$

$$P(\bar{X} - p \ge \varepsilon) \le$$

Hoeffding's Lemma

► Hoeffding's Lemma: Let Z be a random variable with E[Z] = 0, and $Z \in [a,b]$ with probability 1. Then, for any t > 0, we have $E[e^{tZ}] \le \exp\left(\frac{t^2(b-a)^2}{2}\right)$

• Question: If $Z \sim \text{Bernoulli}(p)$, then $E[e^{t(Z-p)}] \leq$

Proof of Hoeffding's Inequality (Negative Part)

$$P(\bar{X} - p \le -\varepsilon) = P(p - \bar{X} \ge \varepsilon) \le \exp(-2n\varepsilon^2)$$

• [Hint] Chernoff bound: $P(X \ge a) \le e^{-ta} \cdot M_X(t)$

$$P(p - \bar{X} \ge \varepsilon) \le$$
